Algebraic structure

A non empty set with one and more binary operation defined over it and satisfying certain laws of binary operation is called algebraic structure or algebraic system.

Groupoid Let  $G$  be any non empty set and  $\circ$  is a binary operation, then the structure  $(G, \circ)$  is called a groupoid or quasi group if  $a \circ b \in G, \forall a, b \in G$  i.e.  $G$  is closed for the binary operation.

If the binary operation ' $\circ$ ' in the set  $G$  satisfied the commutative property is  $a \circ b = b \circ a \forall a, b \in G$  then, the structure  $(G, \circ)$  is said to be a commutative groupoid.

The structure  $(\mathbb{N}, +)$ ,  $(\mathbb{N}, \cdot)$ ,  $(\mathbb{Z}, +)$   
 $(\mathbb{Z}, \cdot)$ ,  $(\mathbb{Q}, +)$ ,  $(\mathbb{Q}, \cdot)$ ,  $(\mathbb{R}, +)$ ,  $(\mathbb{R}, \cdot)$

$(\mathbb{C}, +)$ ,  $(\mathbb{C}, \cdot)$  are all commutative groupoids

Note Here

$\mathbb{N}$  denotes set of Natural number

$\mathbb{Z}$  denotes set of integers

$\mathbb{Q}$  denotes set of Rational number

$\mathbb{R}$  stands for set of Real numbers

And  $\mathbb{C}$  denotes set of Complex numbers.

Semi-Group Let  $G$  be a non-empty set and ' $\circ$ ' be a binary operation defined on it, then the structure  $(G, \circ)$  is said to be a semi-group if 
$$a \circ (b \circ c) = (a \circ b) \circ c \quad \forall a, b, c \in G$$

The structure  $(\mathbb{N}, +)$ ,  $(\mathbb{N}, \cdot)$ ,  $(\mathbb{Z}, +)$ ,  $(\mathbb{Z}, \cdot)$ ,  $(\mathbb{Q}, +)$ ,  $(\mathbb{Q}, \cdot)$ ,  $(\mathbb{R}, +)$ ,  $(\mathbb{R}, \cdot)$ ,  $(\mathbb{C}, +)$ ,  $(\mathbb{C}, \cdot)$  are commutative semi-group

The structure  $(\mathbb{Z}, \cdot -)$ ,  $(\mathbb{Q}, -)$   
 $(\mathbb{R}, -)$ ,  $(\mathbb{C}, -)$  are not semi-group  
since associative law is not satisfied.

Monoid - Let  $G$  a non-empty  
set and  $*$  be a binary  
operation defined on it. Then the  
structure  $(G, *)$  is said to be  
a monoid if the following  
axioms are satisfied.

(I) Associative law  $a*(b*c) = (a*b)*c$   
 $\forall a, b, c \in G$ .

(II) Existence of identity - There exist  
an element, denoted by  $e$  and  
called the identity in  $G$  such  
that

$$a*e = a = e*a \quad \forall a \in G$$

(i) The structure  $(\mathbb{Z}, +)$ ,  $(\mathbb{Z}, \cdot)$ ,  $(\mathbb{Q}, +)$   
 $(\mathbb{R}, +)$ ,  $(\mathbb{R}, \cdot)$ ,  $(\mathbb{C}, +)$ ,  $(\mathbb{C}, \cdot)$  are  
monoid.

The structure  $(\mathbb{Z}, +)$ ,  $(\mathbb{Z}, \cdot)$ ,  $(\mathbb{Q}, +)$ ,  $(\mathbb{Q}, \cdot)$

$(\mathbb{R}, +)$ ,  $(\mathbb{R}, \cdot)$ ,  $(\mathbb{C}, +)$ ,  $(\mathbb{C}, \cdot)$  are monoids.

(ii) The structure  $(\mathbb{N}, +)$  is a semi-group but not a monoid, since the additive identity (i.e. 0) does not exist in  $\mathbb{N}$ .

### Group

Let  $G$  be a non-empty set and  $*$  be a binary operation defined on it then the structure  $(G, *)$  is said to be a group if the following axioms are satisfied.

(i) Closure Property  $a * b \in G \forall a, b \in G$

(ii) Associativity. - If  $a, b, c \in G$  then  $(a * b) * c = a * (b * c) \forall a, b, c \in G$

(iii) Existence of identity - There exists an element  $e \in G$  such that

$$a * e = a = e * a \forall a \in G$$

$e$  is called identity of  $*$  in  $G$ .

(iv) Existence of inverse. For each element  $a \in G$  there exist an element

$b \in G$  such that

$$a * b = e = b * a$$

The elt  $b$  is called the inverse of element  $a$  with respect to ' $*$ ' and we write

$$b = a^{-1}$$
