

UNIT 1

What is Software?

A Software is a set of programs containing data and instructions that perform operations and tasks, basically telling a computer how to work. Without a software a computer can't perform a single task. Some common software example that many businesses use in daily operations include Microsoft Office, Chrome, PowerPoints and Excel.

There are two types of software.

- ① Application software
- ② System software

Application Software :- Application Software

refers to the programs designed to perform specific tasks for end-users such as web browsing, gaming, word processing, etc.

System Software :- System software manages hardware and basic system operations and serves as a ~~bridge~~ foundation for application software. It serves as a bridge between hardware and user and ensures that the system operate efficiently and effectively.
