

Unit- 2 Compounds of p-Block Elements

---

- **Examples:**
  - **Water (H<sub>2</sub>O):** Bent structure, extensive H-bonding
  - **Ozone (O<sub>3</sub>):** Resonance hybrid with partial  $\pi$ -character

**2. Sulfur (S):**

- **Limited  $p\pi-p\pi$  bonding**
- **Catenation** (S-S bonds common)
- **Uses d-orbitals**
- **Example: Sulfuric acid (H<sub>2</sub>SO<sub>4</sub>)**
- S=O bonds:  $d\pi-p\pi$  character

**3. Selenium and Tellurium:**

- Increasing metallic character
- Semiconductor properties

**GROUP 17: HALOGENS**

**1. Bonding Characteristics:**

- **High electronegativity**
- Form both covalent and ionic bonds
- **Oxidation states:** -1 to +7 (except F, max 0)
- **Examples:**
  - **Interhalogens (ClF, BrF<sub>3</sub>, IF<sub>7</sub>):** Various hybridizations
  - **Polyhalides (I<sub>3</sub><sup>-</sup>):** 3c-4e bonding
  - **Hypohalous acids (HOX):** Polar O-H bond

**2. Fluorine (F):**

- **Highest electronegativity**
- **Small size** allows strong bonds
- **Limited oxidation states** (only 0 and -1)
- No d-orbital participation

**GROUP 18: NOBLE GASES**

**1. Bonding (in compounds):**

- **Xenon** forms maximum compounds
- **Hybridization:**  $sp^3d$ ,  $sp^3d^2$ ,  $sp^3d^3$

**Unit- 2 Compounds of p-Block Elements**

---

- **Examples:**
  - **XeF<sub>2</sub>**: Linear (sp<sup>3</sup>d)
  - **XeF<sub>4</sub>**: Square planar (sp<sup>3</sup>d<sup>2</sup>)
  - **XeF<sub>6</sub>**: Distorted octahedral (sp<sup>3</sup>d<sup>3</sup>)

**4. Special bonding phenomena in p-block elements**

**A. INERT PAIR EFFECT**

**Definition:** Reluctance of ns<sup>2</sup> electrons to participate in bonding in heavier elements

**Examples:**

1. **Tl(I) vs Tl(III):** Tl<sup>+</sup> more stable than Tl<sup>3+</sup>
2. **Pb(II) vs Pb(IV):** Pb<sup>2+</sup> more stable than Pb<sup>4+</sup>
3. **Bi(III) vs Bi(V):** Bi<sup>3+</sup> more stable than Bi<sup>5+</sup>

**Reason:**

- Poor shielding by d- and f-electrons
- Increased effective nuclear charge
- Relativistic effects in heavy elements

- **B. HYBRIDIZATION AND GEOMETRY**
- **Common Hybridizations in p-Block:**

Hybridization	Geometry	Examples
sp	Linear	CO <sub>2</sub> , C <sub>2</sub> H <sub>2</sub> , BeCl <sub>2</sub>
sp <sup>2</sup>	Trigonal planar	BF <sub>3</sub> , SO <sub>3</sub> , NO <sub>3</sub> <sup>-</sup>
sp <sup>3</sup>	Tetrahedral	CH <sub>4</sub> , NH <sub>4</sub> <sup>+</sup> , SO <sub>4</sub> <sup>2-</sup>
sp <sup>3</sup> d	Trigonal bipyramidal	PCl <sub>5</sub> , SF <sub>4</sub>
sp <sup>3</sup> d <sup>2</sup>	Octahedral	SF <sub>6</sub> , PF <sub>6</sub> <sup>-</sup>
sp <sup>3</sup> d <sup>3</sup>	Pentagonal bipyramidal	IF <sub>7</sub>

- **C. RESONANCE AND DELOCALIZATION**

Unit- 2 Compounds of p-Block Elements

---

Important Examples:

1. Carbonate Ion ( $\text{CO}_3^{2-}$ ):

- **Resonance hybrid** of three equivalent structures
- **$\pi$ -electron delocalization** over three O atoms
- All C-O bonds equal length (intermediate between single and double)

2. Benzene ( $\text{C}_6\text{H}_6$ ):

- **Aromatic system** with delocalized  $\pi$ -electrons
- **Hückel's rule:**  $4n+2$   $\pi$ -electrons ( $n=1$ )

3. Borazine ( $\text{B}_3\text{N}_3\text{H}_6$ ):

- "Inorganic benzene"
- Delocalized but polarized  $\pi$ -system
- $\text{B}^+\delta\text{-N}^-\delta$  polarity reduces aromaticity

D. HYDROGEN BONDING

In p-Block Elements:

1. With N, O, F:

- Strong hydrogen bonds
- **Example:** Water, ammonia, HF

2. With other elements:

- Weaker hydrogen bonds possible
- **Example:** C-H $\cdots$ O, N-H $\cdots$ S bonds

Practical applications of bonding concepts

Predicting Properties from Bonding

1. Melting/Boiling Points:

- Covalent network solids: Very high (diamond, SiC)
- Molecular covalent: Low to moderate
- Ionic compounds: High

2. Electrical Conductivity:

- Metals: Good conductors
- Covalent network: Insulators/semiconductors

**Unit- 2 Compounds of p-Block Elements**

---

- Molecular covalent: Insulators

**3. Solubility:**

- "Like dissolves like" principle
- Polar compounds dissolve in polar solvents
- Non-polar in non-polar solvents

**4. Synthetic Applications**

**1. Designing New Materials:**

- Semiconductors (Si, GaAs)
- Superconductors (YBCO)
- Polymers (silicones, polyphosphazenes)

**2. Catalysis:**

- Lewis acid catalysts ( $\text{BF}_3$ ,  $\text{AlCl}_3$ )
- Phosphines as ligands in organometallic catalysts

**3. Pharmaceuticals:**

- Boron compounds in cancer therapy (BNCT)
- Organosulfur compounds in drugs

**4. 7. SUMMARY TABLE: BONDING PATTERNS IN p-BLOCK**

Group	Element	Characteristic Bonding	Example
<b>13</b>	B	Multicenter, electron-deficient	$\text{B}_2\text{H}_6$ (3c-2e bonds)
<b>13</b>	Al	Ionic/covalent mix	$\text{AlCl}_3$ (dimerizes)
<b>14</b>	C	Strong $\text{p}\pi\text{-p}\pi$ , catenation	$\text{C}_2\text{H}_4$ ( $\pi$ -bond)
<b>14</b>	Si	$\text{p}\pi\text{-d}\pi$ , limited catenation	$\text{SiO}_2$ (network)
<b>15</b>	N	Strong $\text{p}\pi\text{-p}\pi$ , lone pair	$\text{N}_2$ (triple bond)
<b>15</b>	P	d-orbital participation	$\text{PCl}_5$ ( $\text{sp}^3\text{d}$ )
<b>16</b>	O	$\text{p}\pi\text{-p}\pi$ , H-bonding	$\text{H}_2\text{O}$ (bent)
<b>16</b>	S	$\text{p}\pi\text{-d}\pi$ , catenation	$\text{S}_8$ (crown)

Unit- 2 Compounds of p-Block Elements

Group	Element	Characteristic Bonding	Example
17	F	High polarity, no d-orbitals	HF (H-bonded)
17	I	Multiple oxidation states	IF <sub>7</sub> (sp <sup>3</sup> d <sup>3</sup> )
18	Xe	Noble gas compounds	XeF <sub>4</sub> (square planar)

- **Important P-Block Compounds (with Applications)**

## 1. Boron Compounds (Group 13)

### Boric Acid (H<sub>3</sub>BO<sub>3</sub>)

- Weak monobasic Lewis acid
- Planar structure

#### Applications

- Antiseptic and eye wash
- Glass and ceramic industry
- Nuclear reactors (neutron absorber)

### Borax (Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O)

#### Applications

- Water softening
- Glass manufacture
- Flux in metallurgy

### Borazines

- Inorganic analogue of benzene

#### Applications

- High-temperature ceramics
- Polymer chemistry

### Borohydrides (NaBH<sub>4</sub>)

#### Applications
